

Gas Cap Latch Fix

Thank you for your order of The Z Garage's gas cap latch fix! This fix was designed to support the cables linking the latch by the driver's seat to the mechanism in the trunk under the tool tray. The mechanism is operated with a cable that pulls through the center to open the hatch or the plastic surround which is pulled to pop the gas cap. This plastic part can break, not allowing the latch to properly release the gas cap. This fix binds the cable surround to the metal latch restoring the factory function.

Installation process:

- 1) Remove/ reposition the carpet in your trunk out of your way. Then remove the tool tray.
- 2) The fix will simply slide over the existing mechanism however if the original plastic piece is still around the line to the hatch mechanism, the metal bracket holding the line from the driver's seat may need to be pulled forward a small amount and the plastic piece moved so the fix will slide over the latch. The fix can be installed with the original plastic piece still on the line- this will not affect the operation of the gas cap or trunk.
- 3) Replace the tool tray and carpet.
- 4) Enjoy your gas cap being popped when you want it to!
